V.B. Buber, A.L. Buber

2

Dispatcher – breakout lines

V.B. Buber, A.L. Buber

Balance equations

$$W_{end} = W_{beg} + Q - R$$

Bathymetric function

$$H = f(W)$$

H – reservoir level

3

Water users' requirements number

K

k -th requirement penalty function

$$F_k = V_k \times P_k$$

V_k

number of violation years for the k -th water user

P_k

penalty coefficient for the k -th water user

Total objective function

$$F = \sum_{k=1}^K F_k$$

The compromise dispatch schedule

$$DS \text{ with } F = F_{min}$$

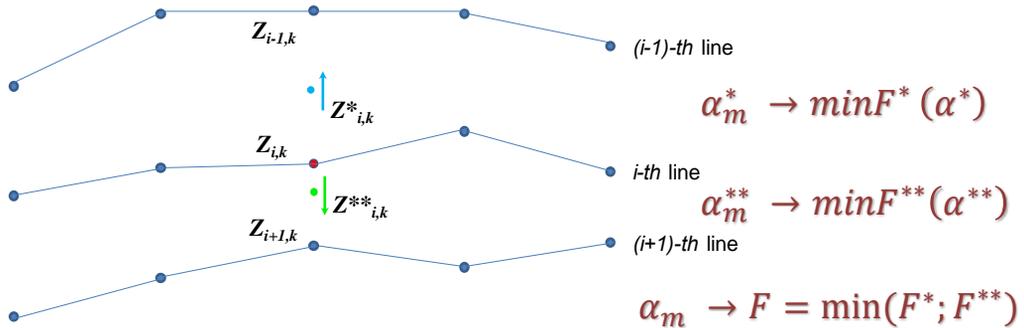

V.B. Buber, A.L. Buber

4

Dispatcher optimization by nodal points shifting

Upward shifting $Z_{i,k}^* = Z_{i-1,k} \cdot \alpha^* + Z_{i,k} \cdot (1 - \alpha^*)$

Downward shifting $Z_{i,k}^{**} = Z_{i+1,k} \cdot \alpha^{**} + Z_{i,k} \cdot (1 - \alpha^{**})$

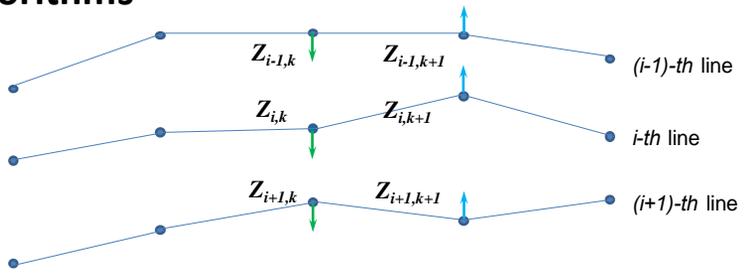

V.B. Buber, A.L. Buber

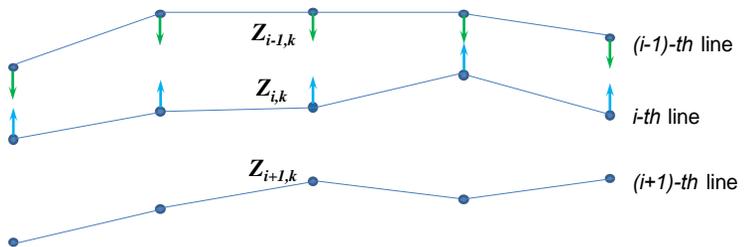

5

V and H optimization algorithms

V - "Vertical"

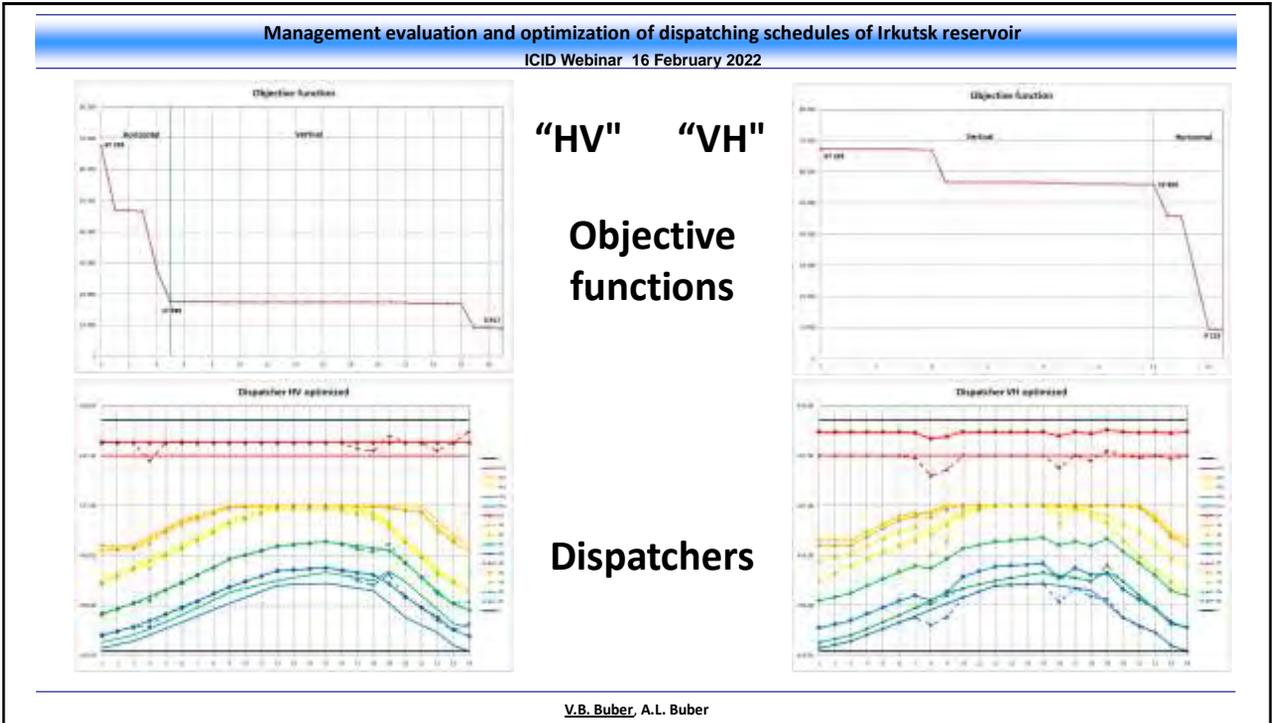

H - "Horizontal"

V.B. Buber, A.L. Buber
